VentiFlex FFS - Self-Venting Bag for Fine Powder Packaging

Rainproof, Clean & Recyclable
Sustainable Packaging Solutions
for a better world

Scientex VentiFlex FFS Concept

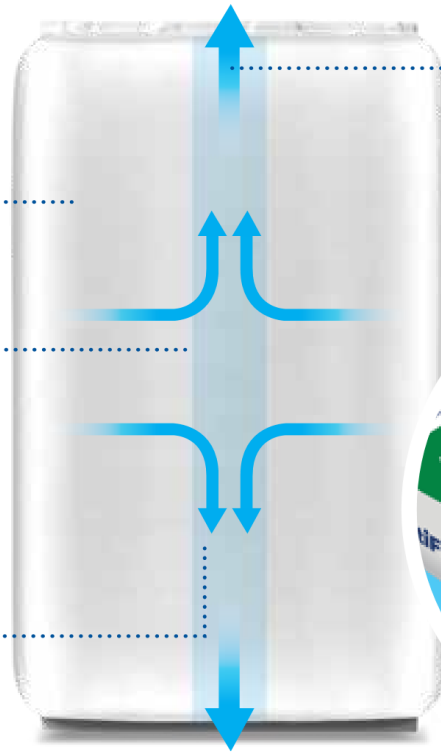

Scientex's VentiFlex FFS features a venting system that enables excess air to escape the bag after the filling process without exposing the product packaged inside.

This innovative, self-venting, weatherproof, tubular FFS film is approved for use on FFS machinery and offers enhanced sealability and durability for building materials and powdery products.

Essential for maintaining a dust-free appearance and **extending product shelf life**

Enables air to be pushed **into the channel** from inside the bag during the flattening process.

Allow air to **flow freely**

Enables air to be released **from the filled bag** after sealing while preventing product loss

Extend Shelf life – High moisture barrier compare to paper bags allowing moisture sensitive goods such as dry mixes (mortar, plaster and cement) to be stored outdoors for extended periods.

Cleanliness – With its unique self-venting system, it maintains a clean and dust-free working environment, even when bagging fine powder bulk materials.

Optimum Speed – Optimum filling speed due to superior deaeration rates from the self-venting/breathing channel system without powder leakage.

Presentation Diversity – Optimum presentation quality from high printing quality up to 10 colors with matt or gloss surface resulting in instant attraction contribute to brand recognition.

Strength – PE bags are stronger and less prone to damage and leaks during transportation and storage due to superior strength, impact and tear resistance compare to paper bags.

Environmental Sustainability – 100% recyclable compare to paper bag which needs separation PE liner from the paper. Able to incorporate recycled content into the bag to reduce waste, conserve resources and minimizes environmental impact.
